PBBS ENGINEERED SERVICES

There are times in this industry when problems arise or projects require the expertise of engineers to get the job done.

PBBS' engineering staff is available to assist you with every aspect of your steam or hot water system, whether it be finding an answer to a lingering problem or designing improvements in your system.

PBBS engineers can help you with a variety of solutions, from providing energy analysis of your facility, evaluating savings potential for retrofit projects to developing diagrams and scope of supply for larger projects such as boiler installations or controls upgrades.

What makes PBBS Engineered Services different than the average consultant?

At PBBS, we specialize in boilers and boiler systems. Our engineers work with boiler systems all the time, not part time. This gives us the unique advantage and ability to see your project through to the end – without being distracted by a massive construction project that seems more important than yours.

So when it comes to needing engineering assistance, you could hire the large firm with a hundred engineers and a hundred other projects or you can contact PBBS' Engineered Services to start building a better system from the ground up.
